Machines are very helpful objects to most of today's society. Their functions are making work easier from transportation to robots in the hospital that assist with surgery. What if those machines that are supposed to help get through our lives actual hurt us or even worse, kill us? That is the kind of outcome that can result from an untested machine.

As technology advanced, we somehow became more relying on them. We just have to have the next big thing in our fingertips. You can't afford it? Go into dept. That is our mentality. Did you even stop and ask yourself how useful that product is to you. How does this have to do with untested machines? Well, everything, if you think about it. You see, if an autonomous car is manufactured, and sold without conducting rigorous inspection, out of nowhere, it malfunctions, causing it to speed up without braking.....

That's a scenario that can occur in any moment and as a result, it is why one like me would oppose the use of machines that make one's life very simple yet filled with unexpected outcomes. Aside from the danger machines pose, they also make us lazy. How you say? How does a self-driving car sound? Cool yeah? But what is it for. To get you to your destination faster? Or is it because it allows to relax. All of this is just another word for laziness.

Some people will say that the idea of autonomous vehicles is game changing. Now you have big car manufactures making plans to put the new tech on the roads by 2020. You even have other companies like google and apple trying to get in the business, why? Because as always- potential for big money, not to make people "safer" as they claim

In conclusion, my side on the issue of untested machines is clear- under no circumstances they should be sold to the public or operated near those civilians. The product may look perfect but you may never know until it is too late.
